DXView is a powerful nautical chart viewing and navigation tool for power PC users. It provides a powerful, flexible, and full-featured tool for surveying the earth's surface from the air. There are many features in the program. First and foremost it is a floating-point nautical chart viewer that is designed to help you make accurate and concise visual observations of the Earth from airplanes. The program can be used to view millions of aerial navigation points over the surface of the Earth. The points are obtained from sources such as ADS-B, Google Earth,

GADEM, and from the ICAO file maintained by the United States Federal Aviation Administration (FAA). Over 2 million points are in the database maintained by the program. The points have points of interest, which may be detailed weather forecasts, airports, VOR's, NDB's, islands, land, freeways and highways, and even cities. DXView is designed to display terrain contours and other map detail. The program can quickly zoom out to view the largest detail available and then zoom in for a close-up view. DXView is a powerful survey tool that is designed to let you save observed points to the database and keep a record of flights and observations. The program supports the

standard.kmz file type and has multiple features to help create and manage survey data. The program allows you to save sets of data to a KMZ file, and find points on the file using the map display as well as by geographic coordinates. DXView has a variety of features that allow you to preview satellite imagery from sources such as Google Earth and Imagine at various levels of detail. There is a tool that will allow you to project the image and zoom and pan in the same manner as the map display. The imagery can be projected onto the map display from multiple satellites. There is support for projected cartographic data from Landsat, ASTER, and MODIS. You can also create your own projections for

data. The program supports all of the legacy GSAT satellites. DXView also has search support that allows you to search for points of interest using various criteria. DXView also supports a powerful features that allows you to create custom drop downs that let you observe various conditions. The user can select which factors to plot on the fly. Weather conditions such as surface pressure, winds, temperature, vertical visibility, visibility, cloud type, dew point, precipitation, relative humidity, and other factors can be plotted on the map display.
